CPC **F16L 27/0857** (2013.01)

A gimbal joint includes a gimbal ring, a first fitting pivotally connected to the gimbal ring such that the first fitting pivots about a first axis, and a second fitting pivotally connected to the gimbal ring such that the second fitting pivots about a second axis substantially orthogonal to the first axis. The gimbal ring further includes a separable sealing element having a cylindrical portion with a first rounded end and a second rounded end. The gimbal ring, the first fitting, the second fitting, and the separable sealing element define a fluid pathway.

SEALED GIMBAL JOINT

FIELD OF INVENTION

The present disclosure relates to a flexible gimbal joint for pipes. More particularly, the present disclosure relates to a flexible gimbal joint having a separable sealing element.

BACKGROUND

Flexible joints for tension piping systems are known in the art. In one known application, such flexible joints are used in aircraft duct systems, such as compressor bleed air and anti-icing lines. Ball and socket joints provide flexibility while transmitting an axial tension load. Gimbal joints having an internal gimbal ring or an external gimbal ring are also known.

SUMMARY OF THE INVENTION

In one embodiment, a flexible gimbal joint includes a first fitting configured to be coupled to an end of a first pipe. The first fitting has an end with a pair of first opposing ridges that define a pair of first opposing recesses. The flexible gimbal joint also includes a second fitting configured to be coupled to an end of a second pipe. The second fitting has an end with a pair of second opposing ridges that define a pair of second opposing recesses. The second fitting is aligned with the first fitting such that the pair of first opposing ridges are received in the pair of second opposing recesses and the pair of second opposing ridges are received in the pair of first opposing recesses. Such alignment defines a portion of a fluid pathway.

The flexible gimbal joint in this embodiment further includes a gimbal ring having first opposing portions pivotally coupled to the pair of first opposing ridges of the first fitting, and second opposing portions pivotally coupled to the pair of second opposing ridges of the second fitting. The flexible gimbal joint also has a separable sealing element disposed about the portion of the fluid pathway, the separable sealing element having a cylindrical portion with a first rounded end and a second rounded end.

In another embodiment, a gimbal joint includes a gimbal ring, a first fitting pivotally connected to the gimbal ring such that the first fitting pivots about a first axis, and a second fitting pivotally connected to the gimbal ring such that the second fitting pivots about a second axis substantially orthogonal to the first axis. The gimbal ring further includes a separable sealing element having a cylindrical portion with a first rounded end and a second rounded end. The gimbal ring, the first fitting, the second fitting, and the separable sealing element define a fluid pathway.

In yet another embodiment, a flexible joint for a fluid pathway includes a first tube portion, a second tube portion, a separable sealing element having a cylindrical portion and at least one rounded end, and a gimbal ring. The gimbal ring is pivotally connected to the first tube portion by a first pair of fasteners. The gimbal ring is pivotally connected to the second tube portion by a second pair of fasteners that are substantially orthogonal to the first pair of fasteners.

BRIEF DESCRIPTION OF THE DRAWINGS

In the accompanying drawings, structures are illustrated that, together with the detailed description provided below, describe exemplary embodiments of the claimed invention. Like elements are identified with the same reference numerals. It should be understood that elements shown as a single

2

component may be replaced with multiple components, and elements shown as multiple components may be replaced with a single component. The drawings are not to scale and the proportion of certain elements may be exaggerated for the purpose of illustration.

FIG. 1 is an exploded view of one embodiment of a gimbal joint 100;

FIG. 2 is a side view of the gimbal joint 100 of FIG. 1;

FIG. 3 is a cross section of the gimbal joint 100 of FIG. 1;

FIG. 4 is a side view of the gimbal joint 100 of FIG. 1 in an angled position;

FIG. 5 is a cross section of the gimbal joint 100 of FIG. 1 in an angled position;

FIG. 6 is a side view of an alternative embodiment of a gimbal joint 200;

FIG. 7 is a cross section of the gimbal joint 200 of FIG. 6; and

FIG. 8 is a cross-section of an alternative embodiment of a gimbal joint 300.

DETAILED DESCRIPTION

FIG. 1 illustrates an exploded view of one embodiment of a gimbal joint 100. FIGS. 2 and 3 illustrate a side view and cross-section, respectively, of the gimbal joint 100. FIGS. 3 and 4 illustrate a side view and cross-section, respectively, of the gimbal joint 100 in an angled position. The gimbal joint 100 is described with reference to all of FIGS. 1-5.

The gimbal joint 100 is a flexible joint configured to connect a first pipe (not shown) to a second pipe (not shown) to define a fluid pathway. The gimbal joint includes a first fitting 102, a second fitting 104, a gimbal ring 106, and a separable sealing element 108.

The first fitting 102 may also be referred to as first tube portion. The first fitting 102 has a first end 110 configured to receive the first pipe, and a second end 112. The second end 112 of the first fitting 102 has a pair of first opposing ridges 114a,b that define a pair of first opposing recesses 116a (the second recess is hidden from view).

The second fitting 104 may also be referred to as second tube portion. The second fitting 104 has a first end 118 configured to receive the second pipe and a second end 120. The second end 120 of the second fitting 104 has a pair of second opposing ridges 122a,b that define a pair of second opposing recesses 124a,b. The first fitting 102 is aligned with the second fitting 104 such that the pair of first opposing ridges 114a,b are received in the pair of second opposing recesses 124a,b and the pair of second opposing ridges 122a,b are received in the pair of first opposing recesses 116a,b. This alignment of the first and second fittings 102, 104 defines a portion of the fluid pathway.

The gimbal ring 106 includes first opposing portions 126a,b pivotally coupled to the pair of first opposing ridges 114a,b of the first fitting 102. In the illustrated embodiment the first opposing portions 126a,b include a first pair of apertures 128a,b that correspond to a second pair of apertures 130a,b in the pair of first opposing ridges 114a,b of the first fitting 102. When the gimbal ring 106 and the first fitting 102 are aligned, the first pair of apertures 128a,b and second pair of apertures 130a,b receive a first pair of fasteners 132a,b and first set of bushings 134a,b. The first pair of fasteners 132a,b and first set of bushings 134a,b define a first axis A₁ about which the first fitting 102 pivots. It should be understood, however, that the illustrated pivotal connection is merely exemplary. Alternative pivoting connections may be used, including, without limitation, rivets, swivel connectors, posts extending from the first fitting that are received in apertures in

the gimbal ring, posts extending from the gimbal ring that are received in apertures in the first fitting, and other pivotal connectors.

The gimbal ring **106** further includes second opposing portions **136a,b** pivotally coupled to the pair of second opposing ridges **122a,b** of the second fitting **104**. In the illustrated embodiment the second opposing portions **136a,b** include a third pair of apertures **138a,b** that correspond to a fourth pair of apertures **140a,b** in the pair of second opposing ridges **122a,b** of the second fitting **104**. (Aperture **140a** is hidden in this view.) When the gimbal ring **106** and the second fitting **104** are aligned, the third pair of apertures **138a,b** and fourth pair of apertures **140a,b** receive a second pair of fasteners **142a,b** and second set of bushings **144a,b**. The second pair of fasteners **142a,b** and second set of bushings **144a,b** define a second axis A_2 about which the second fitting **104** pivots. The second axis A_2 is substantially orthogonal to the first axis A_1 . It should be understood, however, that the illustrated pivotal connection is merely exemplary. Alternative pivoting connections may be used, including, without limitation, rivets, swivel connectors, posts extending from the first fitting that are received in apertures in the gimbal ring, posts extending from the gimbal ring that are received in apertures in the first fitting, and other pivotal connectors.

In the illustrated embodiment, the gimbal ring **106** is external to the first and second fittings **102**, **104**. In an alternative embodiment (not shown), the gimbal ring is internal to the first and second fittings.

The separable sealing element **108** includes a cylindrical portion **146** with first and second spherical, or rounded ends **148a,b**. Because both the first and second ends of the separable sealing element **108** are spherical or rounded, it may be referred to as a “double bubble” separable sealing element. In an alternative embodiment (not shown), a separable sealing element having a single spherical or rounded end (referred to as a “single bubble” separable sealing element) may be employed.

The separable sealing element **108** is disposed about the portion of the fluid pathway defined by the first and second fittings **102**, **104**. In the illustrated embodiment, the separable sealing element **108** is internal to the first and second fittings **102**, **104**. The first fitting **102** receives the first rounded end **148a** of the separable sealing element **108** and the second fitting **104** receives the second rounded end **148b** of the separable sealing element. In this embodiment, the first fitting **102** receives a first insert ring **150** that receives the first rounded end **148a** of the separable sealing element **108**. Similarly, the second fitting **104** receives a second insert ring **152** that receives the second rounded end **148b** of the separable sealing element **108**. In an alternative embodiment (not shown), the first and second fittings directly receiving the ends of the separable sealing element.

In the illustrated embodiment, the gimbal ring **106** is substantially centered about the separable sealing element **108**. In other words, the gimbal ring is disposed about the cylindrical portion **146** of the separable sealing element **108**. In such an embodiment, the rounded ends **148a,b** of the separable sealing element **108** angulate through only half of the total angulation of the gimbal joint **100**. In an alternative embodiment (not shown), the gimbal ring may be disposed about the first or second rounded end of the separable sealing element.

The separable sealing element **108** is configured to not resist torsional movement. The separable sealing element **108** is configured to distort upon pivoting of the first fitting **102** about the first axis A_1 , and upon pivoting of the second fitting **104** about the second axis A_2 .

FIGS. **6** and **7** illustrate a side view and cross-section, respectively, of an alternative embodiment of a gimbal joint **200**. The gimbal joint **200** is described with reference both FIGS. **6** and **7**.

The gimbal joint **200** is a flexible joint configured to connect a first pipe (not shown) to a second pipe (not shown) to define a fluid pathway. The gimbal joint **200** includes a first fitting **205**, a second fitting **210**, a gimbal ring **215**, and a separable sealing element **220**. The gimbal joint **200** is substantially the same as the gimbal joint **100**, except for the differences described herein.

The first fitting **205** may also be referred to as first tube portion, and is pivotally coupled to the gimbal ring **215** about a first axis in the same manner as the first fitting **102** and gimbal ring **106** shown in FIGS. **1-5** and described above. The second fitting **210** may also be referred to as second tube portion, and is pivotally coupled to the gimbal ring **215** about a second axis substantially orthogonal to the first axis, in the same manner as the second fitting **104** and gimbal ring **106** shown in FIGS. **1-5** and described above. Although the gimbal ring **215** is shown as external to the first and second fittings **205**, **210**, it should be understood that in an alternative embodiment, the gimbal ring may be internal to the first and second fittings.

The separable sealing element **220** is a double bubble separable sealing element having a cylindrical portion **225** with first and second rounded ends **230a,b**. In an alternative embodiment (not shown), a single bubble separable sealing element may be employed.

The separable sealing element **220** is disposed about the portion of the fluid pathway defined by the first and second fittings **205**, **210**. In the illustrated embodiment, the separable sealing element **220** is external to the first and second fittings **205**, **210**. The first rounded end **230a** of the separable sealing element **220** receives the first fitting **205** and the second rounded end **230b** of the separable sealing element **220** receives the second fitting **210**. The first fitting **205** includes a first flange **235** that receives the first rounded end **230a** of the separable sealing element **220**. Similarly, the second fitting **210** includes a second flange **240** that receives the second rounded end **230b** of the separable sealing element **220**. Together, the first flange **235** and second flange **240** retain the separable sealing element about the fluid pathway.

In the illustrated embodiment, the separable sealing element **220** is substantially centered about the gimbal ring **215**. In other words, the cylindrical portion **225** of the separable sealing element **220** is disposed about the gimbal ring **215**. In such an embodiment, the rounded ends **230a,b** of the separable sealing element **108** angulate through only half of the total angulation of the gimbal joint **200**. In an alternative embodiment (not shown), the first or second rounded end of the separable sealing element may be disposed about the gimbal ring.

The separable sealing element **220** is configured to not resist torsional movement. The separable sealing element **220** is configured to distort upon pivoting of the first fitting **205** about the first axis, and upon pivoting of the second fitting **210** about the second axis.

FIGS. **8** illustrates a cross-section of an alternative embodiment of a gimbal joint **300**. The gimbal joint **300** is a flexible joint configured to connect a first pipe (not shown) to a second pipe (not shown) to define a fluid pathway. The gimbal joint **300** includes a first fitting **305**, a second fitting **310**, a gimbal ring **315**, and a separable sealing element **320**. The gimbal joint **300** is substantially the same as the gimbal joints **100** and **200**, except for the differences described herein.

5

The first fitting **305** may also be referred to as first tube portion, and is pivotally coupled to the gimbal ring **315** about a first axis in the same manner as the first fitting **102** and gimbal ring **106** shown in FIGS. 1-5 and described above. The second fitting **310** may also be referred to as second tube portion, and is pivotally coupled to the gimbal ring **315** about a second axis substantially orthogonal to the first axis, in the same manner as the second fitting **104** and gimbal ring **106** shown in FIGS. 1-5 and described above. Although the gimbal ring **215** is shown as internal to the first and second fittings **305**, **310**, it should be understood that in an alternative embodiment, the gimbal ring may be external to the first and second fittings.

The separable sealing element **320** is a double bubble separable sealing element having a cylindrical portion **325** with first and second rounded ends **330a,b**. In an alternative embodiment (not shown), a single bubble separable sealing element may be employed.

The separable sealing element **320** is disposed about the portion of the fluid pathway defined by the first and second fittings **305**, **310**. In the illustrated embodiment, the separable sealing element **320** is external to the first and second fittings **305**, **310**. The first rounded end **330a** of the separable sealing element **320** receives the first fitting **305** and the second rounded end **330b** of the separable sealing element **320** receives the second fitting **310**. The first fitting **305** includes a first flange **335** that receives the first rounded end **330a** of the separable sealing element **320**. Similarly, the second fitting **310** includes a second flange **340** that receives the second rounded end **330b** of the separable sealing element **320**. Together, the first flange **335** and second flange **340** retain the separable sealing element about the fluid pathway.

In the illustrated embodiment, the separable sealing element **320** is aligned with the second rounded end **330b** of the gimbal ring **315**. In other words, the gimbal ring **315** is off-center with respect to the separable sealing element **320**. In an alternative embodiment (not shown), the separable sealing element is aligned with the first rounded end of the gimbal ring.

In all of the disclosed embodiments, the fittings, gimbal ring, and separable sealing element may all be constructed of the same material. In one known embodiment, all of the components are constructed of titanium. Alternatively, one or more of the fittings, gimbal ring, and separable sealing element may be constructed of different material. In one known embodiment, the fittings are constructed of titanium, and the separable sealing element is constructed of a different metal or a polymeric material.

To the extent that the term “includes” or “including” is used in the specification or the claims, it is intended to be inclusive in a manner similar to the term “comprising” as that term is interpreted when employed as a transitional word in a claim. Furthermore, to the extent that the term “or” is employed (e.g., A or B) it is intended to mean “A or B or both.” When the applicants intend to indicate “only A or B but not both” then the term “only A or B but not both” will be employed. Thus, use of the term “or” herein is the inclusive, and not the exclusive use. See, Bryan A. Garner, A Dictionary of Modern Legal Usage 624 (2d. Ed. 1995). Also, to the extent that the terms “in” or “into” are used in the specification or the claims, it is intended to additionally mean “on” or “onto.” Additionally, to the extent that the terms “on” or “onto” are used in the specification or the claims, it is intended to additionally mean “in,” “into,” or “near.” Furthermore, to the extent the term “connect” is used in the specification or claims, it is intended

6

to mean not only “directly connected to,” but also “indirectly connected to” such as connected through another component or components.

While the present disclosure has been illustrated by the description of embodiments thereof, and while the embodiments have been described in considerable detail, it is not the intention of the applicants to restrict or in any way limit the scope of the appended claims to such detail. Additional advantages and modifications will readily appear to those skilled in the art. Therefore, the disclosure, in its broader aspects, is not limited to the specific details, the representative apparatus and method, and illustrative examples shown and described. Accordingly, departures may be made from such details without departing from the spirit or scope of the applicant's general inventive concept.

What is claimed is:

1. A flexible gimbal joint for a first pipe and second pipe, the flexible gimbal joint comprising:

a first fitting configured to be coupled to an end of the first pipe, the first fitting having an end with a pair of first opposing ridges that define a pair of first opposing recesses;

a second fitting configured to be coupled to an end of the second pipe, the second fitting having an end with a pair of second opposing ridges that define a pair of second opposing recesses, the second fitting being aligned with the first fitting such that the pair of first opposing ridges are received in the pair of second opposing recesses and the pair of second opposing ridges are received in the pair of first opposing recesses, wherein such alignment defines a portion of a fluid pathway;

a gimbal ring having first opposing portions pivotally coupled to the pair of first opposing ridges of the first fitting, and second opposing portions pivotally coupled to the pair of second opposing ridges of the second fitting; and

a separable sealing element disposed about the portion of the fluid pathway, the separable sealing element having a cylindrical portion with a first spherical end and a second spherical end, wherein the first fitting receives the first spherical end of the separable sealing element and the second fitting receives the second spherical end of the separable sealing element.

2. The flexible gimbal joint of claim 1, wherein the separable sealing element is configured to not resist torsional movement.

3. The flexible gimbal joint of claim 1, wherein the gimbal ring is substantially centered about the separable sealing element.

4. The flexible gimbal joint of claim 1, wherein the gimbal ring is external to the first fitting and the second fitting.

5. The flexible gimbal joint of claim 4, wherein the first fitting includes a first flange that receives the first spherical end of the separable sealing element and the second fitting includes a second flange that receives the second spherical end of the separable sealing element.

6. The flexible gimbal joint of claim 1, wherein the first fitting and the second fitting are disposed about the separable sealing element.

7. The flexible gimbal joint of claim 1, wherein the first fitting and the second fitting are constructed of a first material, and the separable sealing element is constructed of a second material different from the first material.

8. A gimbal joint comprising:

a gimbal ring;

a first fitting pivotally connected to the gimbal ring such that the first fitting pivots about a first axis;

7

a second fitting pivotally connected to the gimbal ring such that the second fitting pivots about a second axis substantially orthogonal to the first axis; and

a separable sealing element having a cylindrical portion with a first rounded end and a second rounded end,

wherein the first spherical end of the separable sealing element receives an end of the first fitting and the second spherical end of the separable sealing element receives an end of the second fitting, and wherein the gimbal ring, the first fitting, the second fitting, and the separable sealing element define a fluid pathway.

9. The gimbal joint of claim 8, wherein the gimbal ring is substantially centered about the separable sealing element.

10. The flexible gimbal joint of claim 9, wherein the gimbal ring is disposed about the first fitting and the second fitting.

11. The gimbal joint of claim 8, wherein the gimbal ring is disposed about the first fitting and the second fitting.

12. The gimbal joint of claim 11, wherein the separable sealing element is disposed about the gimbal ring.

13. The gimbal joint of claim 8, wherein the separable sealing element is configured to distort upon pivoting of the first fitting.

14. The gimbal joint of claim 8, wherein the separable sealing element is configured to distort upon pivoting of the second fitting.

8

15. A flexible joint for a fluid pathway, the flexible joint comprising:

a first tube portion;

a second tube portion;

a separable sealing element having a cylindrical portion and at least one rounded end; and

a gimbal ring,

wherein the gimbal ring is pivotally connected to the first tube portion by a first pair of fasteners, and

wherein the gimbal ring is pivotally connected to the second tube portion by a second pair of fasteners that are substantially orthogonal to the first pair of fasteners,

wherein the separable sealing element is external to the first and second tube portions.

16. The flexible joint of claim 15, wherein the first and second tube portions are constructed of a first material, and the separable sealing element is constructed of a second material different from the first material.

17. The flexible joint of claim 15, wherein the separable sealing element includes a first rounded end and a second rounded end.

18. The flexible joint of claim 15, wherein the gimbal ring is external to the first and second tube portions.
